Surface wetting and early-stage condensation

Demonstration document - not an experimental publication

ABSTRACT

This synthetic document illustrates a literature-reading workflow. Water molecules interact with a solid surface, and surface wettability may change early-stage nucleation. At fixed temperature and supersaturation, the 35-degree sample nucleates earlier than the 95-degree sample in this made-up example. These observations are demonstration data and must not be cited as scientific evidence.

The example separates a reported observation from a possible explanation. A stronger conclusion would require independent simulations, repeated measurements and appropriate controls.

Contact angle 35 degrees

Contact angle 95 degrees

Synthetic values only. No real researcher or private literature is shown.
